

Advanced High Discrimination Sensing with True Multi-Zone Detection

All of Defenders' Intelliscan Walk-Through Metal Detectors use Continuous-Wave Sensing with true Multi-Zone Detection.

The Eighteen-Zone model is equipped with six computer-controlled horizontal zones of detection which are sub-divided into three vertical segments each, splitting the archway into 18 zones of detection that perform as independent metal detectors.

The vertical segments monitor the left, center and right side of a person while the horizontal zones determine the height at which a weapon, contraband or protected asset is carried.

The display accurately pinpoints the location where an object, or objects, are concealed, and security personnel can immediately target it. This increases the quality, speed and efficiency of screening. It also reduces the physical demands placed on security personnel, as they are no longer forced to conduct a full manual body search.

The LED display of Defenders' Intelliscan Eighteen-Zone Detector pinpoints the exact location of weapons or contraband metal

The eighteen zones act as eighteen separate and independent metal detectors, triggering an alarm in the one zone where the object is located.

Making Our Planet Safer
with Superior Technology

MULTI-ZONE DETECTORS CUT COSTS

- Reduce screening time and increase traffic flow rates
- Reduce the number of detectors, personnel and real-estate required for a high traffic location
- Minimize the physical workload of security personnel
- Increase quality of screening and protection
