

THE ALARM CENTER® FOR WINDOWS®

INTRODUCTION

We started with the idea in 1987 to develop the first generation of PC based automation software systems for the security industry, a more intuitive yet simple to use system. The first step was to involve central station personnel, our clients, the industry experts, in the creation of this new system. The System became known as the *ALARM CENTER*®. What makes the *ALARM CENTER*® stand above the rest is the fact that it was developed and is continually nurtured by security industry experts working side-by-side with leading PC software designers.

Now, with over a decade of industry experience, and thousands of Systems operating in 80 countries, Security Information Systems, Inc. is proud to announce the all *new ALARM CENTER*® for Windows®. All of the great features that were incorporated in our DOS and Networking versions are built into and enhanced in the Windows® product. A stunning new array of improvements also reveal an easy and fast response for dispatchers, more management reports - a true reality-check of your business; all while keeping a easy to use interface that has made the *ALARM CENTER*® the worldwide standard.

Windows® ... it makes the PC easy to use. It is the reason why millions of PC users worldwide are enjoying a faster, easier way of computing. *ALARM CENTER*® for Windows® is intuitive, consistent, logical, requires little training, and is still easy! It operates using the standards that thousands of the other innovative software products utilize on the Windows® platform, making your business management more efficient and more productive.

Welcome to the "next generation" of security automation software. Experience first hand why the *ALARM CENTER*® for Windows® is the most powerful, yet easy to use automation software tool ever developed for the security industry!
